

Pendal Multi-Asset Target Return Fund

Multi-Asset Strategies

ARSN: 623 987 968

April 2020

About the Fund

The Pendal Multi-Asset Target Return Fund (**Fund**) is an actively managed multi-asset class portfolio that invests in Australian and international shares, Australian and international listed property securities, Australian and international fixed interest, cash and alternative investments.

Investment Return Objective

The Fund aims to provide a return (before fees, costs and taxes) of Australian CPI[^] plus 5% per annum over rolling five year periods. The suggested investment timeframe is 5 years or more.

The Fund benchmark is the Australian Consumer Price Index.

Description of Fund

The Fund is designed for investors who are seeking a return that exceeds inflation, diversification across a broad range of asset classes and are prepared to accept some variability of returns.

The Fund aims to generate its returns by investing in shares, listed property securities, fixed interest and alternative investments, both in Australia and globally. To gain its exposure to these asset classes the Fund may invest in shares, bonds, derivatives, unit trusts, exchange traded funds, and listed investment companies/trusts. The Fund will not invest in illiquid assets such as direct property or direct infrastructure.

The Fund's asset allocation is dynamically managed by Pendal, based on an assessment of market valuations, the market/economic cycle and technical indicators. Pendal also seeks to add value and/or reduce risk by employing other strategies such as tactical trades that seek to take advantage of shorter term market dislocations and relative value strategies that focus on mispricing between similar types of financial assets.

Investment Team

The Fund is managed by Michael Blayney who has more than 21 year's industry experience and leads the multi asset investments team at Pendal. The team has a diverse skill set; combining a range of global and domestic market experience and drawing on the resources of Pendal's other specialist teams.

Risks

An investment in the Fund involves risk, including:

- **Market risk** - The risk associated with factors that can influence the direction and volatility of an overall market, as opposed to security-specific risks. These factors can affect one country or a number of countries.
- **International investments risk** – The risk arising from political and economic uncertainties, interest rate movements and differences in regulatory supervision associated with international investments.
- **Currency risk** - Currency exchange rate fluctuation risk arising from investing across multiple countries.
- **Credit risk** - The risk of an issuing entity defaulting on its obligation to pay interest/principal when due.
- **Liquidity risk** - The risk that an asset may not be converted to cash in a timely manner.
- **Derivative risk** - The risk that the Fund makes substantial losses or has volatile returns through the use of derivatives.
- **Counterparty risk** - The risk of another party to a transaction failing to meet its obligations.

Please read the Fund's Product Disclosure Statement (**PDS**) for a detailed explanation of each of these risks.

Other Information

Fund size (as at 30 Apr 2020)	\$146 million
Date of inception	April 2018
Minimum investment	\$25,000
Buy-sell spread ¹	For the Fund's current buy-sell spread information, visit www.pendalgroup.com
Distribution frequency	Quarterly
APIR code	PDL3383AU

¹ The buy-sell spread represents transaction costs incurred whenever you invest or withdraw funds, and may vary from time to time without notice.

Management Costs²

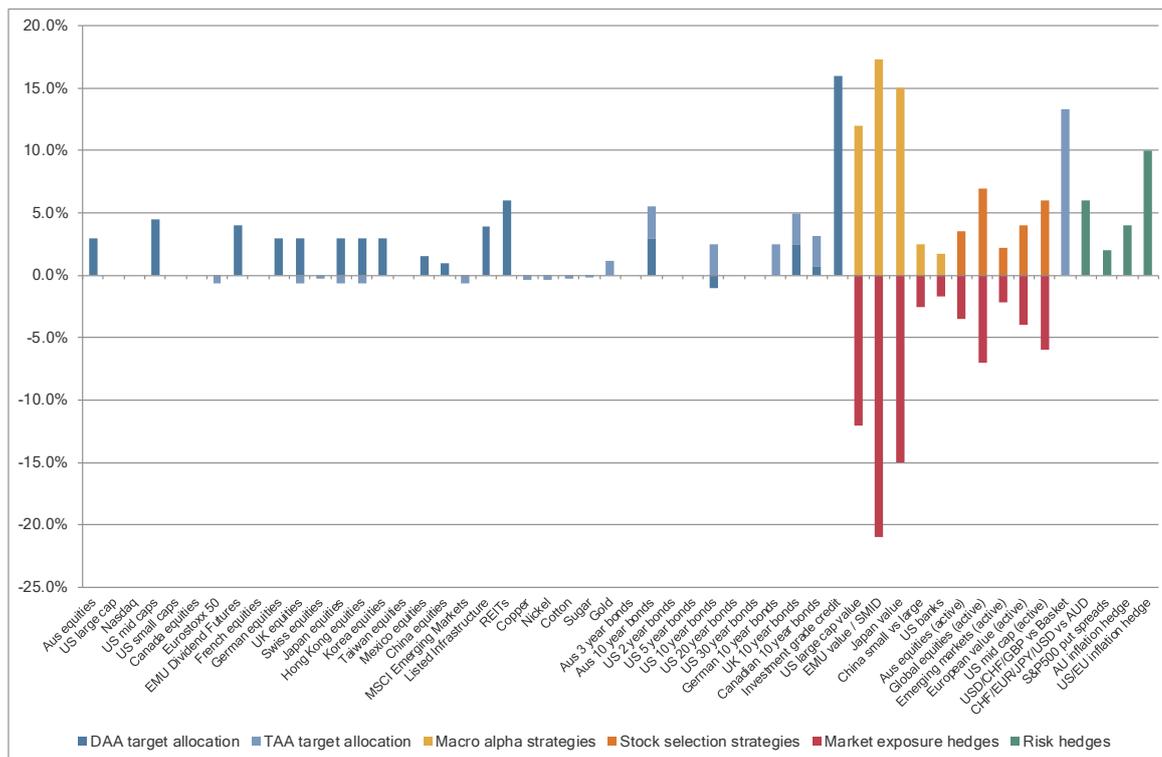

Issuer fee ³	0.78% pa
Estimated indirect costs ⁴	0.04% pa

² You should refer to the latest Product Disclosure Statement for full details of fees and other costs you may be charged.

³ This is the fee we charge for overseeing the operations of the Fund and managing the assets of the Fund. The Issuer fee is paid from the assets of the Fund and is reflected in the unit price of your investment.

⁴ This is an estimate of the last financial year's indirect costs. These are reflected in the unit price of the Fund and are not charged to you as a fee or retained by us.

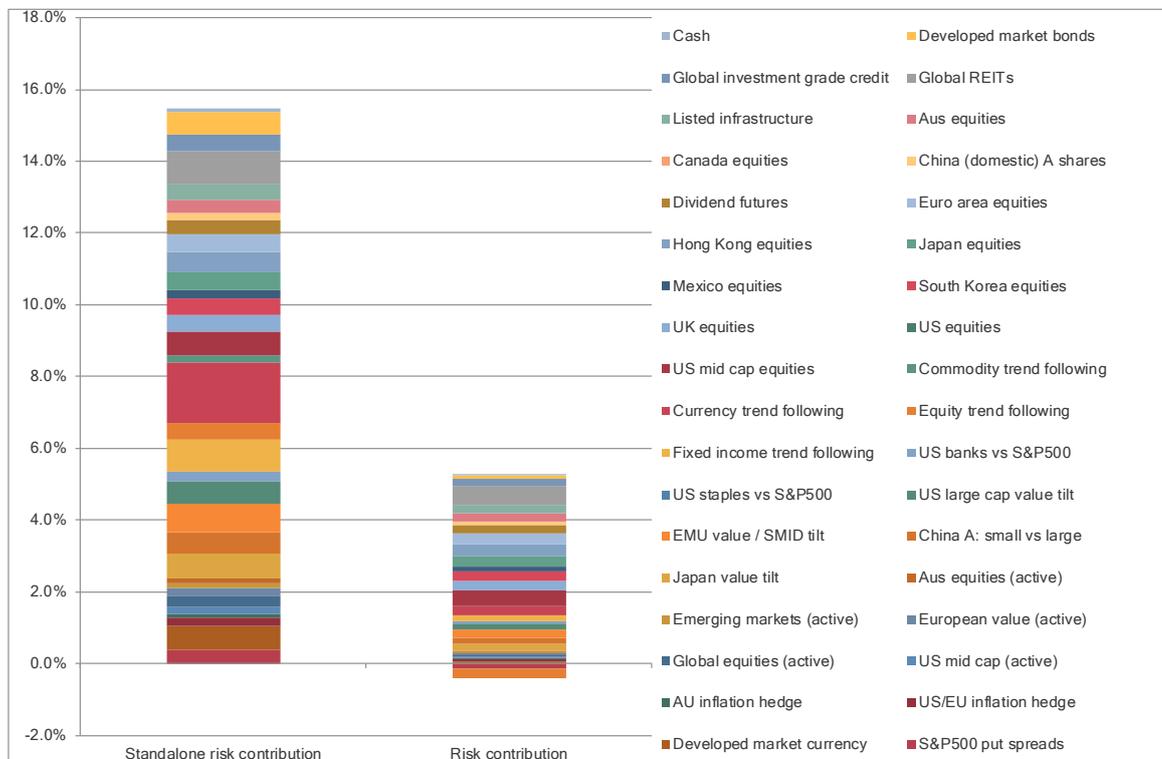

Asset Allocation (as at 30 Apr 2020)

This chart above illustrates the target portfolio weights as at the date shown. Actual weightings may differ from these due to market movements, cash flows and other factors.

Bond futures effective exposure is shown on the basis of 10 year equivalents. i.e. In the above chart, the allocations from 'Aus 3 year bonds' through to 'US 20 year bonds' have been adjusted based on the ratio of the modified duration of the bond future in question to the modified duration of the 10 year bond future in that market. This is to ensure greater consistency in how the exposures from bond futures are shown in the chart across instruments with different maturities.

Risk Allocation (as at 30 Apr 2020)

The risk allocations in the chart above are intended to provide an indication of both the total risk taken in respect of the portfolio at a point in time, and how this is divided up among the different positions held within the portfolio. The total of the "risk contribution" bar represents the expected (forward looking) standard deviation of annual returns for the portfolio, based on the target portfolio weights shown. The "standalone risk contribution" for each position shows the level of volatility when the position is considered in isolation; whereas the "risk contribution" for each position puts this into the context of a total portfolio, allowing for the benefits of diversification.

The risk allocations shown in the chart above are based on the target portfolio weights for the date shown, and use proprietary, forward looking, standard deviation and correlation assumptions for each position in the portfolio, which are based on a combination of historical market returns, finance theory and professional judgement.

The standalone risk contribution for each position is calculated by taking the expected standard deviation of returns for the exposure in question multiplied by its target weighting in the portfolio. It does not allow for diversification benefits from investing in multiple asset classes / positions – this is however allowed for in the risk contribution column.

The risk contribution from each position is calculated as the total expected portfolio standard deviation of returns multiplied by the proportionate contribution to this from the position in question, taking into account its weighting in the portfolio, its own expected standard deviation of returns and its correlation to every other position in the portfolio. This is presented by way of illustration only, and is not intended to provide any guarantee as to the future performance of any asset class or strategy.

Fund manager's commentary

Over April, the Fund returned 4.16%, bringing the return over one year to -4.21% net of fees.

The portfolio's approach to investing combines active asset allocation, tactical risk hedging, and uncorrelated alpha in pursuit of its dual return and risk objectives. The active asset allocation process combines a value-oriented approach, seeking exposure to well-valued assets (dynamic asset allocation) with quantitative trend following strategies across equities, fixed income, commodities and currencies (tactical asset allocation).

"Uncorrelated alpha" refers to strategies that seek to enhance returns without significantly increasing the portfolio's overall exposure to equity or fixed income market risk. Alpha generation focuses on macro alpha (relative value) strategies that seek to exploit relative mis-pricings between similar classes of assets; and also incorporates stock selection alpha (currently predominantly fundamental stock picking strategies with the corresponding market exposure hedged out via futures).

Active asset allocation

Exposure to equity markets contributed positively to returns over the month, with the additional equity exposure added during the volatility of March beneficial. The positions in US mid cap equities and European dividend futures both performed very strongly. As equities have continued to rally, we have reduced exposure slightly, and also purchased some downside protection on the S&P500, which is, we believe, one of the most expensive markets globally. Equities generally continue to offer reasonable value, however not to the degree of "cheapness" that we saw in March. In addition, the impact on earnings from COVID-19 coupled with increased corporate leverage adds significant uncertainty to the outlook, requiring a degree of caution.

Holdings of listed infrastructure and property (REITs) were beneficial, as REITs rebounded strongly from their March lows. We continue to find REITs, and selected listed infrastructure to be attractive value; particularly given the low yield environment.

In commodity futures, long positions in gold and silver both performed well. Gold in particular has benefited from safe haven status and the low interest rate environment. We closed the long position in silver at month end, but continue to hold a modest exposure to gold.

Fixed income had a positive impact on returns over the month, primarily driven by falling credit spreads (credit spreads are the excess yield offered by a corporate bond in excess of an equivalent maturity government bond). Government bond exposure also added a modest amount of value. Within fixed income, we continue to view investment grade corporate bonds as offering the best relative value, given still elevated credit spreads, coupled with limited downside risk over the Fund's investment horizon.

In the "risk hedges" sleeves we hold a mixture of defensive foreign currency exposure (as the Australian dollar tends to fall in times of crisis, making this a good diversifier), tactical long volatility hedges, and strategic inflation hedges ("break-even" inflation – which is the

rate of inflation implied by market pricing of inflation linked bonds vs nominal bonds). Exposure to foreign currencies was a negative contributor to returns as the AUD rose over the month in a more "risk-on" environment. Break even inflation rates recovered from their March lows, contributing positively. Although the VIX Index fell significantly, a long position in longer dated VIX futures was profitable. This was because the VIX futures curve was heavily downward sloping, and hence the longer dated futures offered much better relative value, and so did not suffer (and in fact rose) as the VIX itself fell.

Macro alpha (relative value)

The relative value component of the process had a neutral impact on returns in April, with a tilt towards value stocks in Japan detracting from returns, but being offset by better performance from tilts to value stocks in other regions. Over a 3-5 year horizon, we continue to believe that value stocks represent a compelling investment opportunity, though have increased the (existing) quality screen on some of our baskets of value stocks given the risks associated with higher corporate leverage in this environment.

Stock selection

Stock selection was additive to returns over the month. The best performing strategies were the European Concentrated Value and Emerging Market Opportunities strategy. The US Mid-Caps strategy continued to perform well, while Australian equities was fairly neutral, and Concentrated Global Shares slightly under benchmark.

Overall Portfolio Strategy

Looking forward we maintain a moderate exposure to attractively valued equity markets, while retaining some downside protection via options. In addition, this is supplemented with selected exposure to listed real assets (infrastructure and REITs), which still represent good value in this environment.

Within fixed income, we continue to focus exposure on investment grade bonds, which offer compelling compensation for risk. At the same time, we maintain exposure to interest rate duration, and foreign currency to provide an additional degree of downside protection.

In relative value, value stocks are trading at extreme levels relative to the broader market, and while they have suffered in the COVID-19 sell off on a 3-5 basis represent an excellent opportunity to enhance long term returns.

Overall, the prospective beta of the portfolio (which measures its sensitivity to equity market returns) is currently at its "through the cycle" average, of approximately 0.2. In our view this positioning represents a sensible balance between return seeking and downside risk management, consistent with the portfolio's objectives.
